I thought that this experience went extremely well when working with a team. At first, it took some time getting used to working in different branches but as long as we did not edit within the same file, we did not run into any problems there. I also thought it was very helpful to be able to have someone to lean on when I was struggling. At first, I had the whole cart feature working, however, when I would click the cart button, it would not show up. I asked one of my teammates about it and they were able to identify my error pretty quickly as my functions were in the wrong place. Rather than being in the app file like they were supposed to, they were in my cart file which did not allow for the rendering of the cart when clicked in the nav bar. I believe that our group tried to divide up the work as evenly as we could by us each working on a different part of the app that required state. I think our approach to this project was great, how we had a dedicated plan and worked through our project in the ways of thinking in react. We all made the static version of each of our own parts and then applied state to those versions in order to get the app functioning in the way that we wanted it too. I think we did hit our goals from milestone 1, however upon hearing feedback there is definitely room for improvement, but that is ok as this a lot of our first times diving fully into react. We could have cleaned up the UI and the buttons a little bit, but as long as our app was functioning was our main concern. I believe that from this project, I have been able to better understand how to think in react. Understanding where each function should go is very important to the rendering process of the app.
