Milestone 2:

Component Hierarchy:

Here is our mid-fidelity prototype of what we want our final product to look like:

Data we need/keeping track of:

1. User input

2. Drink info from API (currently viewable from filters)

3. Cart

4. Favorites

For this milestone, I focused on building the static version of the cart. The goal of this was to create a place in which each ingredient needed from whatever item the user choses, will appear in the cart, for them to buy if they want to make the drink. Since this is the static version, nothing is happening when something is clicked. We want for there just to be visual place holders rather than active functional behaviors. I have used static and mock data to show these placeholders, before passing through real time props. I believe that our group has worked well together. We have each agreed to divide and conquer on this step of the project and we all did one of the three branches that falls down from the app. We have done the thinking in react process comeplteted and we have also created a static version of our page. During my time building the cart, I found it very easy to find outside inspiration, such as premade carts available online to help save time with the CSS. The more I'm working on the react side, the more it is making sense to me.

Here is our current mock up static version!
